

# Physics of simple and complex fluids

## Table of contents

- 1.** Introduction: Importance and applications of fluids in science & technology
- 2.** Basic physics of fluids: Description of fluid flow, classification of flow phenomena & flow measurements (rheology)
- 3.** Review of vector calculus and tensor analysis (reminder & identities)
- 4.** The equations of fluid motion: Euler & Navier-Stokes equations (material derivative, mass and momentum conservation)
- 5.** Applications of the Navier-Stokes equations (Bernoulli's theorem, Couette flow, Poiseuille flow, Inviscid flow)
- 6.** Low Re hydrodynamics (Stokes flow, multipole expansion, lubrication approximation)
- 7.** Flow instabilities & pattern formation: phenomenology & mechanisms (Taylor & Rayleigh instabilities)
- 8.** Turbulence
- 9.** Hydrodynamics of suspensions (constitutive equations & hydrodynamic interactions)
- 10.** Polymer dynamics
- 11.** Microfluidics
- 12.** Driven and active fluids
