### 4.4 The Key Selection

To complete the description of the rounds we have yet to describe the key selection. First we expand the 56 bit key to 64 bits by appending a parity bit after each 7 bit subblock. However it doesn't matter which bit we append: the additional bits never enter the algorithm. In any case the first step is a map

$$
\text { Par }: \mathbb{F}_{2}^{56} \longrightarrow \mathbb{F}_{2}^{64}
$$

In the second step we extract the original 56 bits, but in a different order, given by the following table.

| 57 | 49 | 41 | 33 | 25 | 17 | 9 |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 1 | 58 | 50 | 42 | 34 | 26 | 18 |
| 10 | 2 | 59 | 51 | 43 | 35 | 27 |
| 19 | 11 | 3 | 60 | 52 | 44 | 36 |
| 63 | 55 | 47 | 39 | 31 | 23 | 15 |
| 7 | 62 | 54 | 46 | 38 | 30 | 22 |
| 14 | 6 | 61 | 53 | 45 | 37 | 29 |
| 21 | 13 | 5 | 28 | 20 | 12 | 4 |

We have constructed a map

$$
\mathrm{PC}_{1}: \mathbb{F}_{2}^{64} \longrightarrow \mathbb{F}_{2}^{56}
$$

("Permuted Choice 1"). Now we divide the 56 bits into two 28 bit halves, and cyclically shift these to the left, all in all 16 times. This gives 16 maps

$$
\mathrm{LS}_{i}: \mathbb{F}_{2}^{28} \longrightarrow \mathbb{F}_{2}^{28} \quad(i=1, \ldots 16)
$$

the amount of the shifts is given by the table:

$$
\begin{array}{|llllllllllllllll|}
\hline 1 & 1 & 2 & 2 & 2 & 2 & 2 & 2 & 1 & 2 & 2 & 2 & 2 & 2 & 2 & 1 \\
\hline
\end{array}
$$

The first two shifts are by one bit, the next 6 ones by two bits, and so on. To get the $i$-th key selection $A_{i}$ we apply the "Permuted Choice 2" after the $i$-th shift:

$$
\mathrm{PC}_{2}: \mathbb{F}_{2}^{56} \longrightarrow \mathbb{F}_{2}^{48}
$$

where the 48 bits are chosen in the order of the following table (omitting the bits $9,18,22,25,35,38,43,54)$.

| 14 | 17 | 11 | 24 | 1 | 5 |
| ---: | ---: | ---: | ---: | ---: | ---: |
| 3 | 28 | 15 | 6 | 21 | 10 |
| 23 | 19 | 12 | 4 | 26 | 8 |
| 16 | 7 | 27 | 20 | 13 | 2 |
| 41 | 52 | 31 | 37 | 47 | 55 |
| 30 | 40 | 51 | 45 | 33 | 48 |
| 44 | 49 | 39 | 56 | 34 | 53 |
| 46 | 42 | 50 | 36 | 29 | 32 |

The complete key selection is

$$
A_{i}=\mathrm{PC}_{2} \circ \mathrm{LS}_{i} \circ \cdots \circ \mathrm{LS}_{1} \circ \mathrm{PC}_{1} \circ \mathrm{Par}
$$

We summarize this construction in the following diagram:
