

Phase-0 Topological Processor

Uli Schäfer

Johannes Gutenberg-Universität Mainz

Topological Processor

Simulations suggest a need for topological trigger criteria, so as to keep Level-1 trigger effective at high luminosities.

Example algorithms:

- Angular correlations (jets, direction of missing energy)
- Muon isolation
- ...

Hardware implementation

→ Need to feed a maximum of data into a single point (module, FPGA)

- Input from L1Calo and Muons
 - ~ 1 Tb/s aggregate bandwidth
 - Do not partition into multiple modules for reason of latency.

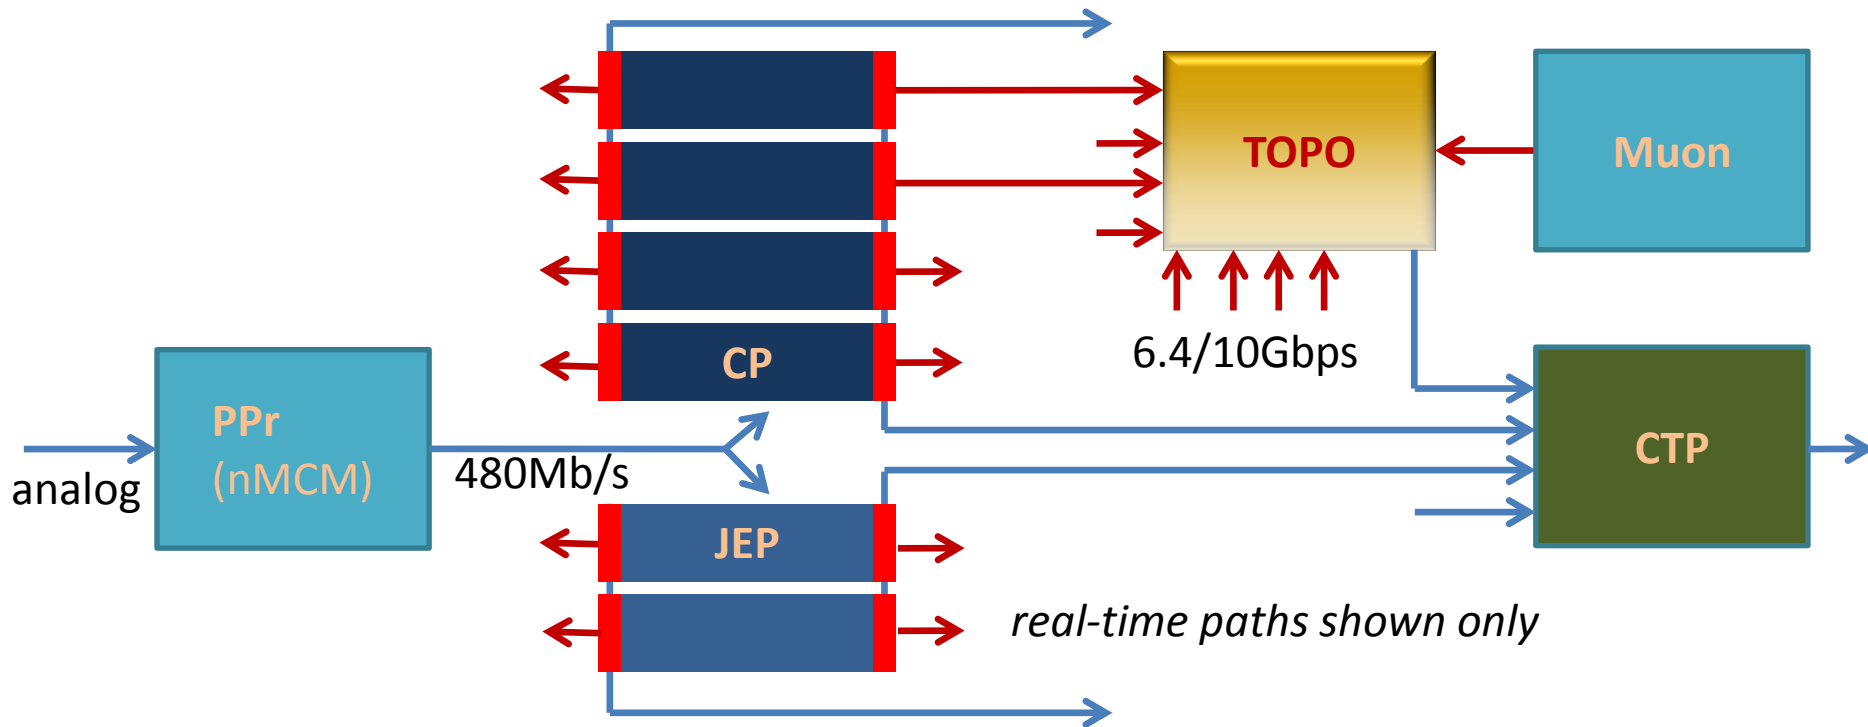

Current L1Calo Scheme

- Mixed Signal Pre-Processor
- FPGA based digital “sliding window” processors (e/m cluster, jet/energy)
- Object count and global quantities via chained mergers **CMM** into CTP
- Object positions to Level-2 and DAQ only

Phase 0 Scheme

- New **CMX** module with two interconnect options
 - Chained (legacy and opto links)
 - Star topology with all opto links into **topological processor**
- Muon information included on topo processor

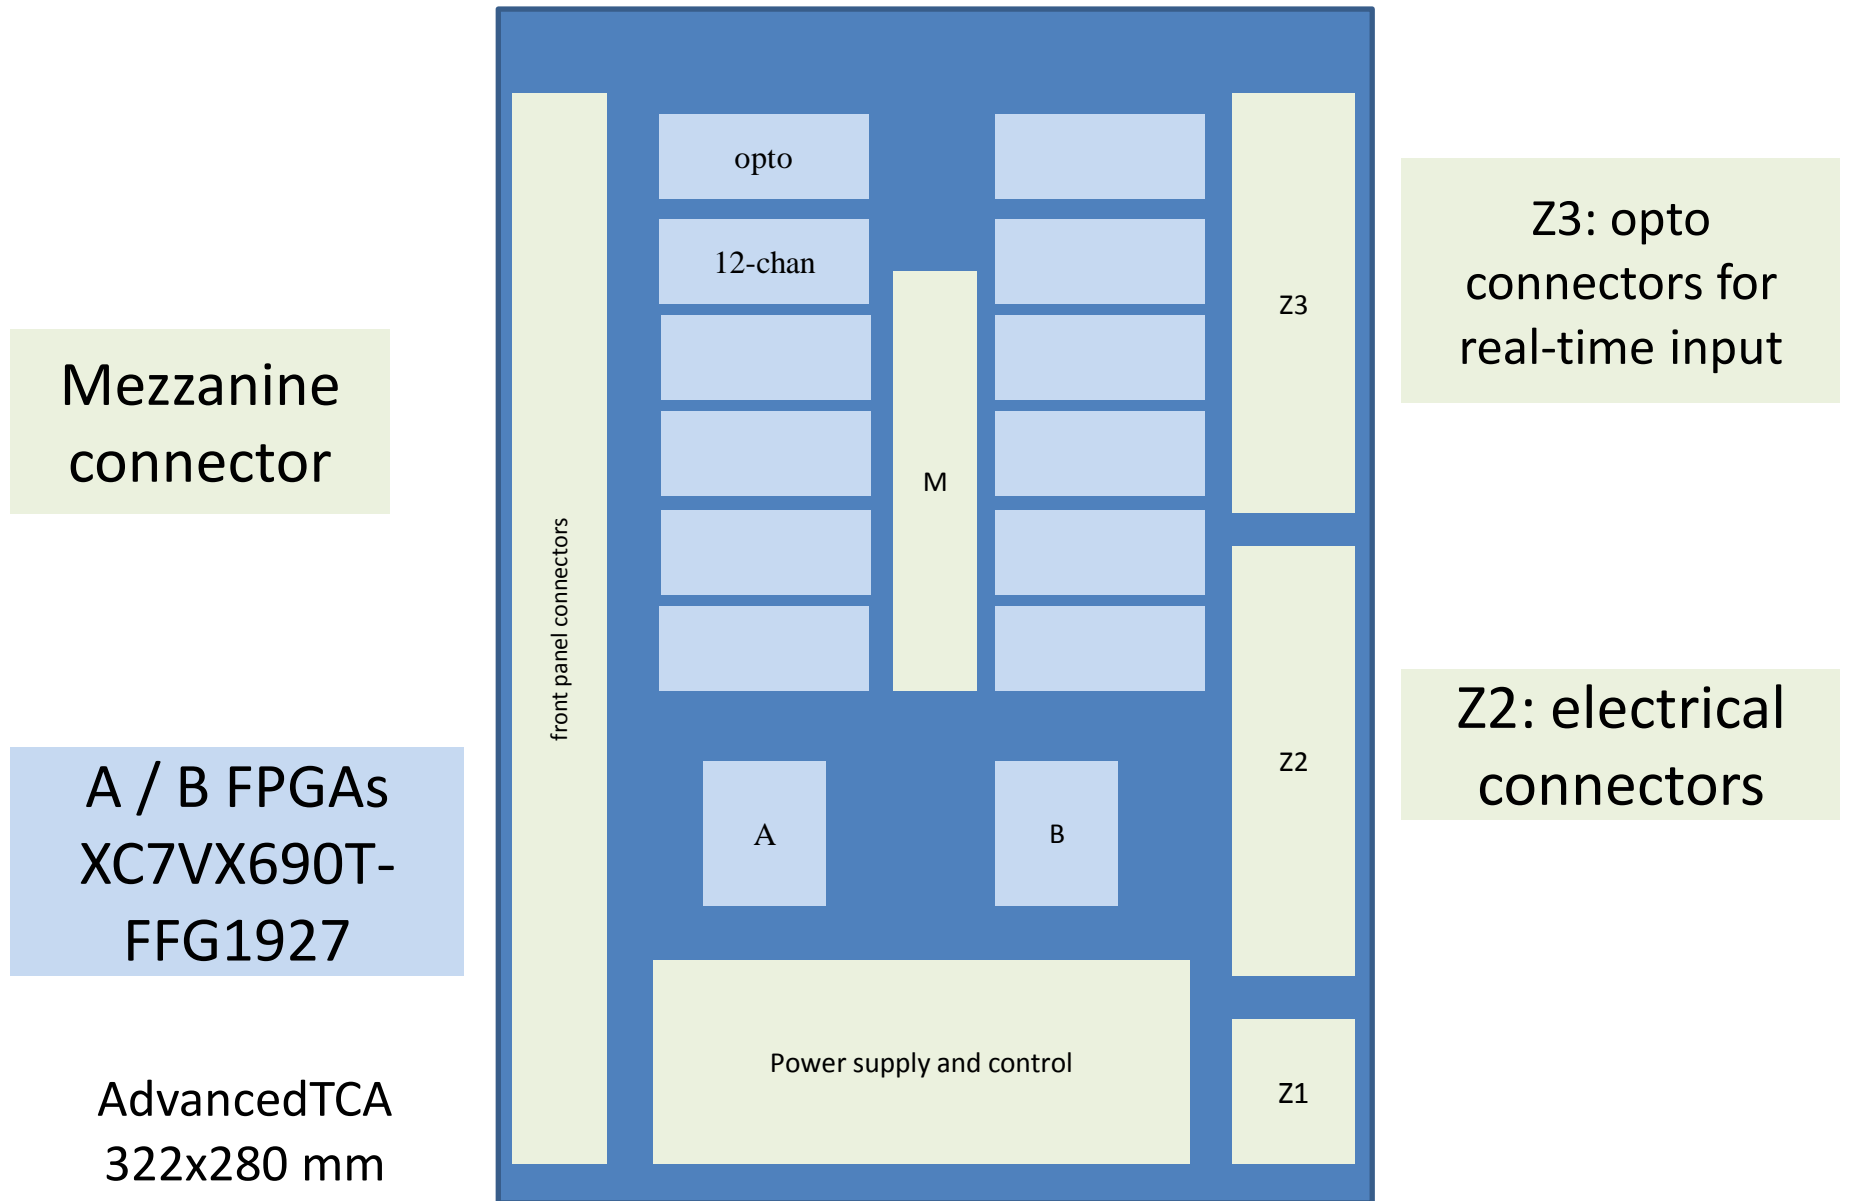

... Topology Processor

- Input from L1Calo and Muons
 - ~ 1 Tb/s aggregate bandwidth
 - Fibre optical inputs @ 6.4/10 Gbps per fibre
- Output to CTP
 - electrical (LVDS)
 - fibre optical ~ 1 Gb/s +
- Interfaces to TTC/GBT/..., Level-2, DAQ, control, DCS,...
- Small number of modules (~ 1)
- Probably dedicated crate, near CTP

Have started upgrade programme

- 2010 : 6.4Gb/s data source **BLT** in CP/JEP crates to live in CMM slots \rightarrow CMX
 - 2011 : Topo processor demonstrator GOLD
- \rightarrow 2013/14 topological processor commissioned in USA15

Phase-0 Topo Processor floor plan

Bandwidth / Algorithms / Latency

Baseline two FPGAs per processor

80 Links/FPGA @ 10Gb/s \rightarrow 1.6Tb/s total \rightarrow 1.28Tb/s payload

Preliminary data formats for jet and cluster processors:

$96 \times (14 \times 8 + 32)$ bit @ 40 MHz \Rightarrow 553Gb/s

For muon data assume data volume comparable to current

MUCTPI input: $16 \times 13 \times 32$ bit @ 40MHz \Rightarrow 267Gb/s

Plus ϵ (energy, ?)

Some level of data reduction on the CMX is being considered

- \rightarrow One or two FPGAs per processor seem appropriate
- \rightarrow Dependent on processing resources required for algorithms one might wish to duplicate processors
 - \rightarrow Forward link duplication for latency minimisation
 - \rightarrow Multiple processors on module
 - \rightarrow Multiple modules in crate

Algorithms

Several algorithms have been suggested:

- Jet $d\phi$
- Cluster $d\phi$
- Muon isolation
- Muon MET
- Jet/cluster overlap removal

Some have been simulated and shown to be effective

Algorithms require

- Sorting of objects to size
- Cuts in η, ϕ
- Possibly cuts for absence of objects in given η, ϕ bin

→ Choose reference algorithm and put in hardware !

Reference Algorithm

- Define bandwidth requirements
- Determine consumption of logic resources
- Determine latency
- Baseline device for Phase-0 topo processor is Virtex-7
- Target for reference algorithm implementation is Virtex-6
 - Xilinx development board now
 - limitations in input channel count, link speed
 - GOLD topo demonstrator in a couple of months time
- Choose an algorithm that has been physics-simulated in MZ and shown effective: Jet $d\phi$

Jet $d\phi$

- Based on preliminary phase-0 JEP backplane data format
- 32 JEMs \times (4 jet candidates \times 14 bits + 8 presence bits)
→ 82Gb/s input bandwidth
- Select two largest candidates in a 6-deep sort tree
- Feed position information into lookup-table to allow for cuts in η and ϕ
- Report single result bit to CTP

First results on a XC6VLX240T:

- 8 % of available CLB LUT resources used
- 5 % of block memory resources used
- Algorithm latency, down to the FPGA pin : 3 LHC bunch ticks

But : mind the gap !

Latency

Latency is actually dominated by the MGT links. Including that we arrive at a total latency :

with buffered transmission scheme : 8 bunch ticks

with phase alignment : 7 bunch

Health warnings:

- Latency figures are preliminary, working on reduction
- Total latency comprises serialisation from 320Mb/s on CMX, de-serialisation to 40Mb/s on topology processor, and algorithm
- Latencies have been calculated from data sheet, obtained from VHDL simulation, and been measured
- Measured link latencies have been extrapolated from 3.2 Gb/s to 6.4Gb/s due to bit rate limitations on Xilinx development board
- Different partitioning of the sort tree into CMX / topo processor will not affect algorithm latency
- “phase alignment” low latency mode has been partially withdrawn / restricted by Xilinx for current devices (errata AR#39430)
- Eventually we will want to target Virtex-7 and should therefore deal with Virtex-7 errata rather than Virtex-6 ones

“GOLD” demonstrator / medium term plans

- (Full-function) demonstrator for phase-0 topology processor
→ <https://indico.cern.ch/getFile.py/access?contribId=19&sessionId=7&resId=2&materialId=slides&confId=112739>
- ATCA format, modular, optical RTM connectivity @ 6.4 / 10Gbps
- L1Calo internal review passed in May
- PCB in production / assembly
- From 08/'11 available for **signal integrity** and **latency** studies
- Test bench for topology algorithms
- Initial system tests with current L1Calo and CMX prototype
- Review input connectivity requirements (including Muons)
- Review processing power requirements (algorithm dependent)
- Topology processor **prototypes** in 2011/12, baseline : Virtex-**7**
- Commission **production** modules in 2013/14 shutdown
- Connect up with CMX and CTP
- Connect up with muons as soon as muon trigger signals become available
- . . .

Backup

The demonstrator : GOLD

- Functional demonstrator for phase-0 topology processor
- Technology demonstrator for technologies to be used throughout L1Calo upgrade programme, studies on fibre optical connectivity schemes

----->

- ATCA form factor
- Modular concept
 - Mezzanines
 - FMC connectors
- Optical backplane connectors rather than front panel I/O
- Opto/electrical conversion on input mezzanine
- Electrical connectivity up to 10Gb/s in ATCA zone 2
- Phase-0 topo-specific connectivity
 - Provide all interfaces

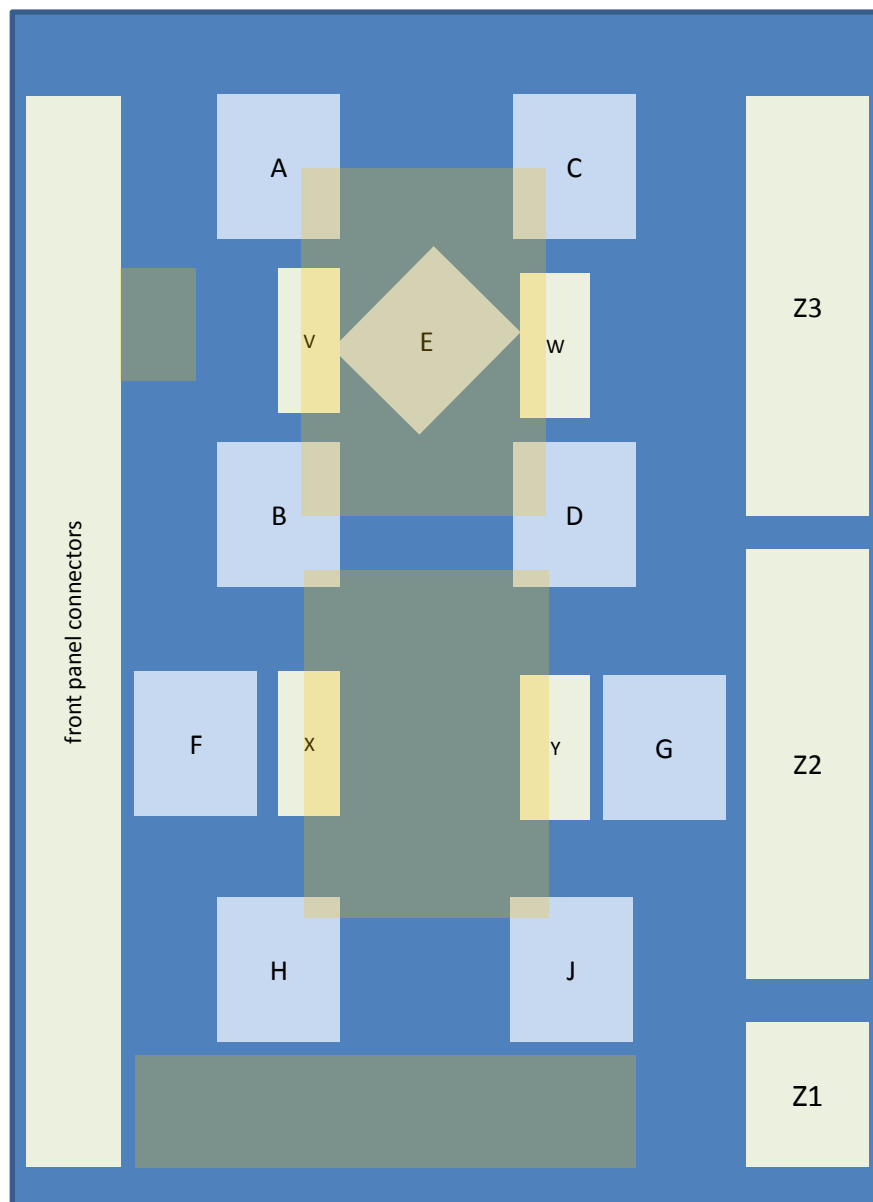

GOLD floor plan

A-J FPGAs

Mezzanines

V – Y : FMC
connectors

AdvancedTCA
322x280 mm

Z3: opto
connectors

Z2: electrical
connectors

Z3

Z2

Z1

GOLD - some details

Main board, ATCA sized, 22 PCB layers

- FPGAs (Virtex-6 LXT, HXT)
- Connectors, sockets for e/o converters
- FPGA configurator and local clocks (DAQ/ROI, Ethernet,...)
- Main power distribution network (central and POL regulators)

Input mezzanine module, allow for choice of input devices and input signal routing

- 12 layers, moderate real estate
- Sockets for o/e converters, 10Gb/s fanout

Clock mezzanine module

- Recover and condition incoming (LHC bunch) clocks
- Some limited clock multiplexing and fan-out
- Provide additional space for auxiliary components and front panel connectivity

GOLD floor plan

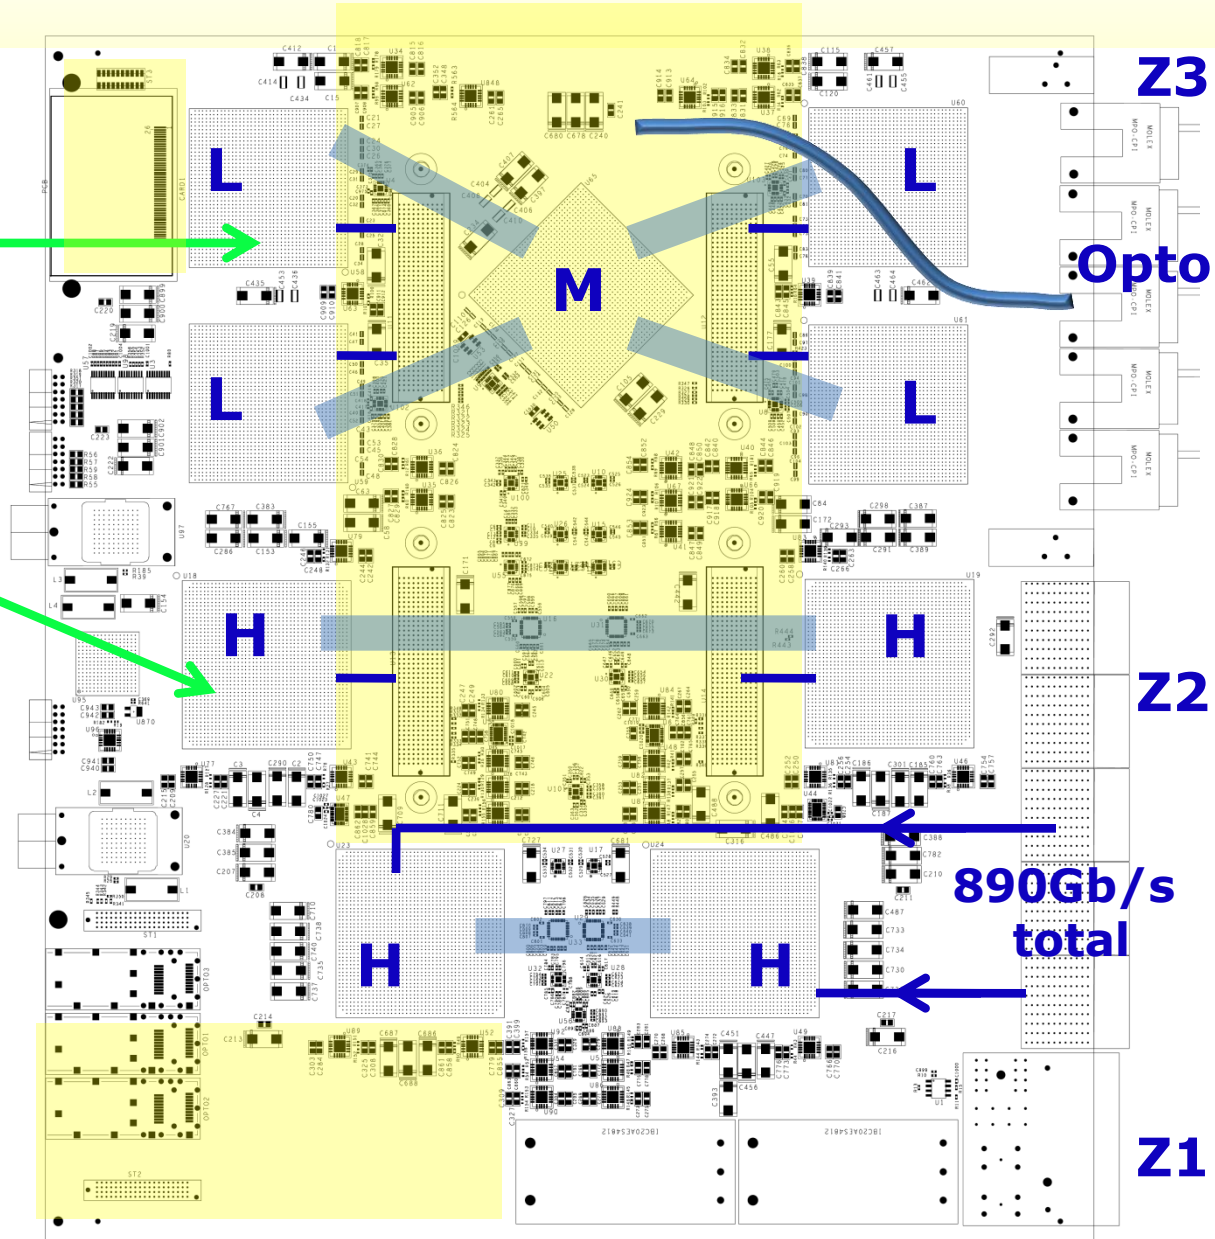

5 * XC6VLX
(Processor **L**, main processor **M**) up to 36 links each

Two pairs of XC6VHX (**H**)
72 links each

5+ 12-channel optos on daughter

Clock generation

144 multigigabit input
links in zone 2 (equiv.
22300 bit / BC)

Densely packed, thick module
